

INDcool Store System

Receiving, stock and dispatch matched to the CRM · status on 3 October 2026

One rule runs through everything: no goods in stock without an approved GRN, and no unit or part leaves the store without an OEM bill number. Every serial number is unique across the whole store.

1. Decisions agreed

Question	Decision
Who physically dispatches a unit	The Store dispatches (not the vendor)
Purchase orders inside the CRM	Yes, the CRM will have POs
Orders created before the Store existed	They keep working as today. Only new orders use stock.
Role names	store_keeper and store_manager, as built
Sub Admin can create store users	Yes
Stores and picking	One store, FIFO (oldest stock first)

2. The flow, step by step

- 1 Purchase.** A PO is raised for complete units and spares. The OEM or supplier ships with a bill or challan.
- 2 Receive (GRN).** The store keeper records the goods. Serial numbers come from a USB or Bluetooth scanner, the phone camera, or typing. Each serial is checked at once for format and duplicates. Damaged goods go to Quarantine.
- 3 Approve and post.** A store manager approves. The creator can never approve their own GRN. Posting creates the stock units and the ledger lines.
- 4 Order reserves stock.** When a vendor order is raised, the matching unit is reserved, oldest first.
- 5 OEM bill gate.** The bill is entered by Admin today and by the Accounts role later. Without a bill number the store cannot issue.
- 6 Dispatch from stock.** The store scans the unit, its serials are written onto the order line, a courier is chosen from Courier Masters, and stock goes out through the ledger.
- 7 Service parts.** The engineer asks, the service manager approves, accounts bills, the store issues, the courier delivers and the engineer ticks receipt. The replaced part's old serial is paired out of the unit passport and kept in Old Stock.
- 8 Return and repair.** Old stock goes back to the OEM or supplier, or to a repair vendor. OEM claims are a separate type. Cancelled orders come back through a Return GRN, are scanned and accepted, and the serials become free again.

3. Roles

Role	Can do
store_keeper	Create and submit GRNs, scan serials, view stock and ledger. Cannot approve.
store_manager	Everything the keeper can, plus approve and post or send back a GRN.
Admin / Sub Admin	Full access to the Store modules. Sub Admin creates store users.
Everyone else	No Store menu. The store pages return access denied.

4. Build status

Stage	Scope	Status
1 · Foundation	Roles, GRN with maker-checker, unique serials, stock, ledger, Store menu and screens	Built and tested locally. Pushed to GitHub. Not deployed.
2 · Orders	PO, order reservation, OEM bill gate, dispatch from stock with serials on the order line	Next. Preview first.
3 · Parts	Unit passport, part requests, engineer receipt, part bills including zero-value warranty bills	Planned
4 · Returns and extras	Old stock, OEM claims, repair and return dispatch, reorder alerts, cancelled-order returns	Planned

5. What was tested in Stage 1

- Keeper created and submitted a GRN with an AC (2 serials), a compressor (1 serial) and 10 fan motors (by quantity).
- A duplicate serial, even in lowercase, was refused.
- Manager approved and posted. Stock by item, serials and the ledger all matched.
- The call-centre role is denied on the store pages.
- The automated test suite has 27 passing tests, 10 of them for the Store.

Not yet tested: phone-camera scanning (needs a real phone).

6. Deployment

Stage 1 adds database migration 0048 and creates the two new roles on first start. Deploy is run by Rajeev with *py scripts/deploy.py*.
